RESEARCH METHODOLOGY

EFFECTS OF HUMAN ACTIVITIES ON ANIMAL HABITATS

KAZOوبا B LAWRENCE 216004505 16/U/5830/PS

MAKERERE UNIVERSITY KAMPALA

INTRODUCTION

over the past millenniums man has done a great deal in trying to evolve and put himself at the top of the food chain "THE MAN OF THE HILL". In so doing he has ensured that he performs whatever possible to reach his goal. As a result man's activities have adversely affected the environment and consequently resulted in massive destruction of animal habitats. Activities like road construction, swamp reclamation, quarrying, and other diverse components of urbanization, it has been of great interest to me as well as other scientists to try to get some solutions. This can only be done through doing enough research and aptly analyzing the data obtained.

OVERVIEW AND BACKGROUND

A habitat can be simply defined as a dwelling place of any animal species. It has been of great interest over the past century for man to try to succor the remaining wild life habitats because some of the unique animal species are vanishing without any hope of ever being recovered.

RESEARCH PROBLEM

Evaluating the damage caused by man's activities on animal habitats over the past 10 years in Uganda

RESEARCH QUESTION

What have been the effects of human activities on animal habitats in Uganda over the past 10 years?

RESEARCH AIM AND SCOPE

Specifically the research is directed towards the locals or natives around the country and they will be one of the chief sources of our data.among other research methods mentioned below.The obtained data shall be of use in formulating solutions to the research problem.

RESEARCH METHODS

Interviewing

observation

Recording audio

Recording Video

OBJECTIVES

To obtain relevant data.

To access the crucial people in society

To to get adequate data

CONCLUSION

Despite the fact that it seems like a battle that cannot be surmounted,there is still hope that change can be wrought collectively in this day and age.
